Placing the ADHEAR System

Hearing has never been so simple: stick the adhesive adapter behind the ear, click the audio processor onto it and hear the world.

1. Clean the skin behind the ear and make sure the hairless area offers enough space to accommodate the adhesive adapter. Ensure that the skin is completely dry before you apply the adhesive adapter.

2. Place the adhesive adapter in the positioning tool and remove the protective film.

3. Place the positioning tool behind the ear so that it lightly touches the ear. Make sure that there is no hair under the adhesive adapter.

4. Push the tool down, pressing the adhesive adapter onto the skin with your finger; the adhesive adapter will remain on the skin when the tool is removed.
5. Connect the audio processor by tilting it onto the snap connector of the adhesive adapter. The audio processor may be adjusted by slightly rotating it to align with the ear.

6. The retention clip provides additional fixation if needed.

7. Disconnect the audio processor from the adhesive adapter by pressing it down on the end closest to the ear, in this way ensuring that the adhesive adapter is not pulled away from the skin.

ADHEAR can be worn discreetly behind the ear. The adhesive adapter only needs to be changed once or twice a week. It can remain on the skin during sleeping, showering (or any other water-related activity) and sports.
